
risk-class coverage c_1 = share of risk posts whose set contains the risk label

workload per 1,000 = 1,000 × share not dismissed; referrals = full or empty sets

$$\text{metric}(\pi) = \pi \cdot \text{metric(risk)} + (1-\pi) \cdot \text{metric(not risk)}$$

e.g. $\text{coverage}(\pi) = \pi c_1 + (1-\pi)\, c_0$
